## (54) APPARATUS FOR COAGULATION OF BIOTEXTURE

(57)Abstract:

PROBLEM TO BE SOLVED: To decrease risk given to a patient and to facilitate handling during coagulation by providing an electrode element for guiding a coagulation electric current into a gas from an HF source and a flow adjusting means to an ionizable gas filling almost completely a space between the electrode element and a biotexture.

SOLUTION: In an endoscope 1, the base end part of a tube 2 inserted into a work channel is connected with an argon source (a compressed gas bottle) 11 by means of a gas feeding pipe 3 and a valve 12. A set mechanism controlled by means of a controller 13 is provided on the valve opening of a valve 12 and the controller 13 controls the set mechanism by the deviation between an output signal of a measuring tool 14 and the value of a set point from a set point controller 15. In addition, an HF source 16 is provided so as to feed an electric energy to a gas flowing in the tube through a connection wire 4. Furthermore, a conical hole 21 is provided on a gas outlet 9 region of a nozzle 20 fixed on the terminal of the tube 2 and it is possible thereby to eject a gas flow in a scattering-like and a little turbulent flow-like condition.

## LEGAL STATUS

[Date of request for examination]

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]

[Date of extinction of right]
